

GILBERT BARTH, PH.D.

Principal, Boulder Office Manager, Hydrologist/Hydrogeologist

AREAS OF EXPERTISE

- Water Resource Evaluations
- Conceptual and Numerical Model Development
- Quantifying Stream/Aquifer Interactions
- Sensitivity Analysis and Parameter Estimation

SUMMARY OF QUALIFICATIONS

Dr. Barth provides quantitative assessments of water-resource and environmental conditions at the local-, basin- and watershed-scale to assess natural resource impacts, address questions associated with water planning, water rights, water-quality assessment, and determine appropriate actions for preserving or restoring hydrologic function. He specializes in model development and calibration, with a focus on quantifying exchanges between surface-water and groundwater systems and the application of sensitivity analysis and parameter estimation. He has developed and applied groundwater simulation models to assist private and public clients throughout the Western United States.

REPRESENTATIVE EXPERIENCE

S.S. Papadopoulos & Associates, Inc., Boulder, CO

- **Lower Rio Grande Regional Model for Groundwater Management**, New Mexico — For the State of New Mexico, in collaboration with a technical committee including agency and stakeholder experts, re-constructed and calibrated a regional model that simulating the surface-water distribution system (river, canals and drains), groundwater extraction systems (urban and rural), farm irrigation recharge, and riparian evapotranspiration for the Rincon and Mesilla Bolsons in southern New Mexico. Conducted parameter estimation and sensitivity analyses (UCODE and PEST, including parallel implementation). Served as an expert in United States Supreme Court No. 141 Original: Texas vs. New Mexico and Colorado.
- **Copper Flats, New Mexico – Tulla Resources Application Review** — For the state of New Mexico, provided expert hydrogeologic support in the evaluation of the Tulla Resources application. Support included evaluation of hydrogeologic conditions, assessment of testimony, evaluation of all technical exhibits, developing recommendations regarding options for completely offsetting impacts, providing an expert report and testifying during the hearing. Additional work included sensitivity analyses of different Copper Flats models, comparing/contrasting predictions, assessing importance of various model assumptions and providing recommendations regarding methods for predicting impacts of additional pumping, specifically Caballo reservoir depletion potential.
- **Glacial-Sediment Stream/Aquifer Model**, Washington — For Whatcom County, Washington, the Lummi Nation, Nooksack tribe and others, developed a three-dimensional flow model of the region encompassing Lynden, Everson, Nooksack, and Sumas down to tertiary bedrock. The model was developed as part of Washington's Water Resource Inventory Area 1 (WRIA1) Watershed Management Plan to assess potential impacts of future growth and/or management practices. The model combines a multi-layer system with a detailed (LIDAR) representation of the land surface

YEARS OF EXPERIENCE: 25+

EDUCATION

Post-Doctoral, USGS/NAS&E, NRC
Research Associate, 1999–2001
PhD, Civil Engineering (Water Resources),
University of Colorado, Boulder, 1999
MS, Civil Engineering (Water Resources),
University of Colorado, Boulder, 1992
BA, Mathematics and Economics, University
of Colorado, Boulder, 1987

PROFESSIONAL HISTORY

S.S. Papadopoulos & Associates, Inc.
2003 to present
University of Colorado at Boulder,
Dept. of Civil Engineering, 2013
Waterstone Inc., 2001–2003
**National Academies of Sciences and
Engineering**, 1999–2001
U.S. Geological Survey, 1997–2001
University of Colorado at Boulder
Dept. of Civil Engineering, 1995–1997
EG&G Rocky Flats, 1992–1995
**Center for Advanced Decision Support
for Water and Environmental
Systems**, 1991–1992

GILBERT BARTH

Hydrologist/Hydrogeologist

and stream network and routing. Model construction includes pilot points of hydraulic parameters to accommodate spatial variability.

- **Pecos Basin Hydrogeological Support**, New Mexico — Re-calibrated and applied the Roswell Artesian Basin Groundwater Model to evaluate the impacts of water transfers. Provided expert testimony on water transfer assessments. Updated the model calibration using recent data including observations from a 72-day pump test and applying PEST parameter estimation software in a parallel implementation. Performed sensitivity analysis and parameter estimation to establish parameterization that provided the best fit for the pump-test observations. Explored prediction uncertainty using Pareto-front methods and estimated weighting. Refined and expanded graphical user interface for the Carlsbad Basin, providing a graphical, map-based interface for assessment of water transfers within the Carlsbad Basin. Provided expert support on NMISC/USBoR Basin Change study, 7-Rivers Wellfield Operational Readiness Testing, evaluating Interpid diversions and other aspects of Pecos Basin Hydrogeology.
- **Salt Basin Evaluation and Model Development Oversight**, New Mexico — Review of prior efforts to characterize the Salt Basin water budget and subsurface flow regime, including assessment of basin recharge and playa discharge from the closed-basin system. Provided expert oversight to New Mexico Tech and New Mexico Bureau of Geology and Mineral Resources on the development of an updated regional flow model for assessing basin water production potential and possible changes to surface water/groundwater interaction and agricultural pumping.
- **High-Resolution Modeling of Rio Grande and San Joaquin Riparian Zones**, New Mexico and California — Updated, extended, and applied very high-resolution groundwater models of the near-river zone along major rivers in California and New Mexico, with capability for simulation of rapidly changing river conditions including overbank flooding. Conducted sensitivity analyses to assess policy-change and drought impacts on riparian-zone restoration plans. Identified net impacts of removing non-native species, and hydrologic conditions and associated management practices that offered potential for native species restoration.
- **Scott River Valley Stream/Aquifer Interactions Evaluation**, California — To evaluate stream depletion impacts from groundwater pumping and the potential for impacting Karuk Tribe fisheries and cultural traditions, constructed a high-resolution groundwater flow model. Incorporated pilot points with zone boundaries and used PEST to generate hydraulic conductivity fields and to support parameterization. Developed code and implemented process for basin-wide mapping of stream depletion factors to support discussions of potential benefits of groundwater management options on stream flow conditions.
- **Model Development for Flathead Nation Water Management**, Montana — For the Confederated Salish and Kootenai Tribes, developed and/or updated three basin-scale models to support evaluation of alternate water-management scenarios. Reviewed initial models, incorporated updated farm budget input, conducted visualization exercises to identify areas where calibration could be improved, and re-calibrated models using a variety of methods, including parameter estimation and sensitivity analysis. Applied pilot points and PEST to generate varying hydraulic conductivity fields within lithologic zones, invoking a variety of PEST utilities to incorporate parameterization through external functions.
- **Model Review to Support State Agency Rule-Making**, Colorado — Evaluated simulation details of a model that was developed to identify the impacts of stream depletion from coalbed methane extraction for purposes of rule-making in a tributary/non-tributary delineation. Decomposed input files and conducted simulations. Evaluated the model's effectiveness in representing the complex geologic structure and surface-water/groundwater interactions. Created visual representations of model output and examined potential issues and/or inconsistencies with the conceptual model.
- **Coupling Analytical Solutions with PEST for Stream Depletion Predictions**, San Juan Basin,

GILBERT BARTH

Hydrologist/Hydrogeologist

Page 3

Colorado — Developed a preliminary but defensible assessment of stream depletion impacts on groundwater production from coalbed methane wells. Implemented a modeling approach to rapidly assess the impacts of over 3000 production wells on nearby streams. Used available pressure observations in an automated parameter estimation procedure in conjunction with a conceptually similar, simple, analytical model to estimate aquifer parameters for use in the Glover analysis. Applied the Glover-Balmer analytical model to calculate the historical and projected stream depletion impacts over a multi-decade period that included monthly well-dependent pumping schedules. The results were used by agency regulators to assess the potential need for additional protective legislation.

- **Forest Management Impacts on Watershed Yield**, Northwestern Washington — Working with Ecotrust for the Upper Columbia Salomon Recovery Board implemented PNNL's Distributed Hydrology Soil Vegetation Model (DHSVM) for the Entiat, Chiwawa and Upper Methow watersheds. Explored parameter sensitivity and developed approach for quantifying predictions of forest management changes on flow metrics critical to salmonid populations.
- **Multiphase Simulation of Methane Gas Migration**, Mississippi — Developed TOUGH2/TMVOC simulations of methane gas release from a salt cavern storage facility. Evaluated updip migration potential moving against regional hydraulic gradients. Estimated potential migration rates and performed a series of sensitivity runs to determine probable range of migration rates. Created animated visualization for client discussions on potential capture scenarios.
- **Numerical Flow Simulation of Chloride Migration Potential**, Montana — For the Fort Peck Assiniboine and Sioux tribes, in an area impacted by brine discharge, used particle-tracking simulations to predict transport traveling through a combination of groundwater and surface water. Applied PEST and analytical methods to conduct parameter sensitivity analysis and particle-tracking prediction uncertainty. Conducted model simulations to predict natural resources impacts and support decision-making regarding the need for replacement water supplies in areas anticipated to be impacted by the brine plume.

Waterstone Environmental Hydrology and Engineering, Inc., Boulder, CO

- **Central Gulf Coast GAM**, Texas — Directed the development of a large (>24,000 sq. mile) regional flow model for the Central Gulf Coast of Texas that evaluated "safe-yield" potential and surface-water impacts for different water-demand scenarios under drought-of-record conditions. Supervised GIS and database personnel who developed structure, screening electronic datasets, and parameterized numerical model inputs (wetlands, evapotranspiration, recharge, and streams). Presented findings to, and interacted with, stakeholders throughout the Central Gulf Coast Region, educating the public on project objectives and status, and responding to public input.
- **Oil Refinery Remediation Planning and Implementation of Oversight**, Casper, Wyoming — For the Wyoming Department of Environmental Quality, in collaboration with BP, provided expert input during BP's investigation and cleanup of an oil refinery. Provided oversight that included reviewing LNAPL monitoring and recovery operations simulation of site hydrologic conditions and of sparging, phytoremediation, in-situ bioremediation; and monitoring of natural attenuation remedies.

National Academies of Sciences and Engineering, National Research Council, Boulder, CO

Sensitivity Methods for Advection-Dominated Flow-and-Transport Modeling — Simulated conservative and reactive transport in heterogeneous saturated subsurface systems using standard flow-and-transport codes, MODFLOW and MT3DMS, respectively. Applied UCODE to develop techniques for parameter estimation and sensitivity analysis under advection-dominated, sharp-front conditions. Implemented the techniques on both PC and UNIX platforms, using a variety of programming languages and operating-system scripts.

EG&G Rocky Flats Environmental Technology Site, Golden, CO

- **Atmospheric, Vadose Zone and Groundwater Field-Site Characterization** — Evaluated vadose zone hydrology and contaminant fate-and-transport potential. Developed a hydrologically based management practice to minimize contaminant movement. Designed and installed a solar-powered, remote automated sensor network for real-time remote monitoring of precipitation, temperature, mass flux, soil moisture, and groundwater elevation. Analyzed sensor data that provided insight to surface-water/vadose-zone/groundwater interaction. Provided samples to analyze the potential for surface infiltration affecting groundwater quality. Directed researchers, engineers, and health-and-safety personnel in equipment design, installation, and operations.
- **Design and Oversight of Vadose Zone Data Collection Solutions** — Designed, provided oversight, and implemented a graphical user interface (GUI) and hardware for automated collection, archiving, and display of vadose-zone conditions including soil moisture, flow, and water quality. The system measured and recorded approximately 3000 observations/day. Development of the GUI was based on project objectives and the needs of collaborators (DOE, USEPA, and the Colorado Department of Health). Supervised the team of engineers and programmers developing the GUI.

Center for Advanced Decision Support for Water and Environmental Systems, Boulder, CO

Surface-Water Allocation under Prior Appropriation, Colorado — Developed a flow-routing algorithm that satisfied prior appropriation and the constraints of the Colorado State Engineer's Office. Collaborated on incorporating the algorithm into an on-line, graphical, Spatial Decision Support System for the South Platte River. Collected adjudicated losses and transit times. Developed algorithms to evaluate water-rights priority and to reallocate the call on the South Platte River based on changes in river flow. Also developed reservoir-exchange algorithms that accounted for impacts to timing of flow delivery in the river and differences in reach losses.

AWARDS & HONORS

Associateship Award, National Research Council, 1999–2001

Editor's Citation, American Geophysical Union, 2000

PROFESSIONAL SOCIETIES

National Ground Water Association

International Association of Hydrological Sciences

American Geophysical Union

APPOINTMENTS

2013: Adjunct Faculty, University of Colorado, Boulder, Department of Civil Environmental and Architectural Engineering

2007 to present: Colorado Riparian Association Board (President, 2010–2011; Treasurer, 2021 -)

2006–2008: Boulder Creek Watershed Initiative

2001–2006: Member, Water Resources Advisory Board, City of Boulder (Chair, 2005–2006)

2002–2006: Member, Greenways Advisory Committee, City of Boulder

DEPOSITION AND TESTIMONY EXPERIENCE

DEPOSITIONS

- 2013 New Mexico Water Hearings Unit. In the Case of 33 Applications. Deposed on the details of support provided to the NMISC regarding water transfer assessments associated with efforts to comply with interstate compacts.
- 2020 United States Supreme Court Original Action No. 141. Deposed as the groundwater modeling expert for the Rincon/Mesilla Groundwater Flow Model, including details associated my Expert and Rebuttal reports.

TESTIMONY

- 2013 New Mexico Water Hearings Unit. In the Case of 33 Applications. Provided expert testimony for the state, assessing water transfers associated with efforts to comply with interstate compacts.
